Addressing the Internet as Socio-Cultural Forms

Introduction

The book explores the Internet within various dimensions of society and situates it within sets of social relations and various cultural contexts. The Internet is conceptualized in its different contexts of production and use as social and cultural forms. The argument is that the Internet is embedded in contemporary socio-cultural forms and by understanding the relations of production, the narratives and participation in these forms one can analyse the Internet's characteristics, meaning and significance to contemporary society. This approach produces an analysis of the Internet that is neither technologically nor socially determined.

To this end, the book discusses core aspects of contemporary social life such as work, citizenship, welfare and inequality as well as culture and everyday life in which the characteristics of the Internet are embedded, shaped and given meaning. Its characteristics such as interactive networked communication, virtual worlds and cyber cultures are understood as they materialize through social and cultural processes into specific social and cultural forms such as mobile work, e-citizenship, diasporic hubs and social networking sites. Through these explorations, the book examines whether society is undergoing transformations in which the Internet plays a part and, if there is change, what the significance of that change is to our understandings of social life. It concludes by arguing society is reconfiguring its forms of communication through its informational and intermediation processes. This communicative turn is resulting in an informational and intermediated society rather than an information society.

Outline and Context of the Argument

The Internet, as part of a whole range of Information and Communication Technologies (ICT),¹ is being used in a number of ways within late modernity.

In general terms, ICT are electronic systems that are used in telecommunications, computer-mediated communication and digital media. Examples of ICT, apart from the Internet, include personal computers, video games, interactive digital television, mobile phones and electronic payments systems. The Internet is a global system of interconnected computer networks that interchange data by packet switching using the standardized Internet Protocol (IP) Suite. It is a 'network of networks' that consists of private and public networks, academic, business and government networks, which are local and global in scope. Copper wires, fibre optic cables, wireless connections and other technologies link these networks. The Internet carries various information resources and services, such as electronic mail, online chat, file transfer and file sharing, online gaming, and the interlinked hypertext documents and other resources of the World Wide Web (WWW). The WWW is a system of interlinked hypertext documents accessed via the Internet. With a Web browser, a user views Web pages that may contain text, images, videos and other multimedia and navigates between them using hyperlinks. The ongoing developments of the WWW include the concept of Web 2.0, which is sometimes referred to as 'social computing' that describes intelligent web services in which users are more active on the Internet. Most Web 2.0 services involve a cluster of dynamic social networks, which the OECD calls the 'participative web' to stress the active roles of users (Frissen, 2008).

The way in which the Internet is produced, used and talked about interacts with, and is embedded in, the dimensions and dynamics of social life. It is, however, difficult to understand the ways in which these technologies are being shaped within the processes of contemporary social change on the one hand and how, on the other hand, they become institutionalized into social and cultural order. To understand the ways in which the Internet interacts with society involves considering the ways in which its characteristics are materializing into social and cultural forms. The use of the concepts of social and cultural forms is well established within the social sciences and is particularly used in sociology and cultural studies. Although these concepts have been adapted in different ways, they nonetheless provide ways in which social scientists can identify the organization of social and cultural life.

Social and cultural forms represent the articulation of economic, political and social dimensions of society. These forms are enacted out in action and interaction; they are performed and reflected back to social actors as material objects and culture. The use of social forms is often focused on social action and social institutions such as, for example, the organization of work, the family, and education and welfare. Cultural forms focus more on action that seeks to express subjective and inter-subjective meaning through specific performances: it thus covers the expression and performance of

popular culture and high culture seen in, for example, film, theatre, visual arts, music and sport. However, aspects of the social and the cultural are interdependent, producing the interlinking of social and cultural forms. For instance, shopping is both a social and cultural activity and, in the context of consumer society, shopping malls can be viewed as cultural forms.² This extends into all domains of social life because the characteristics of social forms are culturally informed, shaped and experienced. Thus, patterns of parenting are given meaning through culture, work related social forms gain their distinctiveness through organizational cultures and entertainment genres foster engagement with audiences culturally in a number of ways such as, for example, fandom. Culture is therefore 'ordinary' as Raymond Williams argues, and communication is culturally shaped, and it makes and remakes culture. The focus on the meaningfulness of communication in all aspects of social life including socio-technical change is embedded in the cultural dynamics of communication and requires an understanding of the relationship between social, economic and cultural dimensions of technological change.

Therefore, although in analytical terms social scientists have made distinctions between social and cultural forms, this is questioned in anthropological terms. Clifford Geertz in particular addresses the interlacing of the social and the cultural. He argues that cultural and social phenomena are symbiotic and that culture is deeply embedded in the realities of social and economic structures (Geertz, 1973). This understanding of the interweaving of the economic, social and cultural aspects of the social world reaches into the richness of communication systems and socio-cultural life, as these systems are at once shaped by economic, social and political imperatives and made meaningful through culture. In this book, the term 'cultural forms' is used to address both the cultural meaningfulness of social forms as well as cultural forms within the genres of entertainment and other culturally defined activities. In effect the book addresses socio-cultural forms, communication and the Internet.

This perspective provides the provenance to address the meaning of communication and ICT in social life, which requires seeing the way people³ communicate as cultural. In this book, the development of cultural forms in which communication is embedded is understood through the following framework. The cultural form has three interdependent dimensions which interact to produce distinctive phenomenon, such as the Internet as a communicative medium in society. One dimension is the 'relations of production', which involves the social organization of production and distribution of the form, including the specific features of the technology. Another dimension is the characteristic mode of narration, which embraces the themes and styles of the form. The third dimension is the type of interaction between producer, narrators and participants that characterizes

participation in the form (Chaney, 1990; Wessels, 2000a). The interaction of these three dimensions and interdependencies generate particular social and cultural forms – socio-cultural forms. The Internet and WWW as a distinctive information and communication form is a cultural form in itself. However, its flexibility and adaptability means that it is also embedded within a range of socio-cultural forms, making it pervasive across society with its presence and absence felt by many people.

The variety of adaptations of the Internet in social and cultural life is shaping experiences of society. The context of these experiences emerges from distinctive modes of production and ways of life. These vary, but these contexts and people's actions within them are how the Internet gains its shape, meaning and use in society. This does not, however, mean that society has transformed into an information society, rather this book shows how society has developed new forms of communication, creating society that is intermediated and informational in new ways. This means that there is an ongoing and embedded interaction of mediated, disintermediated and reintermediated communication weaving through social life that crisscross between and across people and institutions. These combine in different constellations that are made up from different provinces and flows of information and knowledge between institutions and people that occur across time and place in all dimensions of social activity. This book explores the characteristics of this dynamic in the following contexts.

Outline of Chapters

Chapter 2 explores the history of the Internet and the World Wide Web (WWW) and shows how technology is socially shaped and culturally informed. The history of the Internet and the WWW shows how it rapidly developed from its conception in 1962 in military research to its commercialized use in 1995. Its 'relations of production' involve military and academic researchers, graduate students, hackers and various counter cultural groups who work with a narrative of networked computer communication. A key characteristic of participation in Internet related activity is that users actively participate in shaping it. Its history shows how entrepreneurs exploited the early Internet and WWW related values of free and open communication to commercialize it within late capitalism, which introduced commercial dynamics and market inequities into its development. The contradictions between a utopian ideal of free and open communication shaped by its early developers and users and the Internet's subsequent commercialization by entrepreneurs for business, public sector and popular markets are influential in its ongoing development.

Chapter 3 introduces three main approaches to the social study of technology and moves beyond these to argue that technologies including the Internet are socially shaped and culturally informed. The three main approaches are technological determinism, social shaping and social constructivism. These perspectives are extended to show how technology gains meaning in different social contexts through the interaction of social values, cultural sensibilities and economic and political agendas materializing in specific socio-cultural forms. Technologies gain meaning in society by exploring the interdependency of the relations of production with the narratives and forms of participation of cultural forms. There is a need to explore the ways in which the Internet is materializing in an array of social and cultural forms to gain an understanding of the meaningfulness of the Internet within contemporary society.

Chapter 4 addresses the social environment of the Internet and considers whether the Internet is part of a broader social change that is resulting in an 'information society'. First, the discussion addresses the ways in which Internet-based communication interacts with notions of 'time and place' and 'the virtual and the real' and considers how these notions contribute to changing senses of identity, community and civil society. Some of the analysis tends to be overly optimistic, seeing the Internet as a source of liberation by taking social actors out of their established relations of community, institutions, time and place into virtual worlds, techno-spaces and cyber cultures. Pessimistic views, however, include a prognosis of isolated individuals, the break down of community and loss of social interaction. The chapter then addresses changes in economic, occupational spatial and cultural areas to consider if the Internet is part of a transformation that is resulting in an 'information society' or whether society is intermediated and informational without having undergone any fundamental transformations.

Chapter 5 addresses the ways in which the Internet and the transnational informational economy is interacting in the context of work by looking at, for instance, the renegotiation of time and place in tele-work and the renegotiation of gender roles seen in discourse on the demise of 'organizational man' and the rise of 'flexible woman'. Although the Internet is shaped by, and is shaping, new forms of work based on networks, some old work structures and practices are proving resistant to change. The extent, character and consequences of any of these changes are considered through the labour process and the relations between management and labour. There is also an exploration of the implicit promise of 'restored relationships' with a better work-life balance via the 'electronic cottage' and mobile work. These issues are strongly interlaced with the gendering of organizational cultures and women's access to, and experience of, work in an e-enabled economy. They show that the use of the Internet in the

context of work reproduces existing social relations, inequalities and hierarchies as well as challenging work gender relations and inequalities.

Chapter 6 looks at how the 'logic of the Internet' is interacting with changes in the ideology and practice of many aspects of welfare and health provision, education, (local) government and citizenship. It addresses the provision and character of education, welfare and democratic process in the context of the consumerization of the public sphere and examines how the Internet and its networking capacity is being shaped to mitigate between consumer choice and welfare needs. This chapter extends the analysis to show how social values, working practices and technologies interact with the provision of public services and the practices of citizenship. It is also the arena in which issues of access, usage and design are visibly linked to concerns of inclusion and exclusion. Changes in the ideology of welfare – namely the move from a collectivist approach of universal provision to a consumerist welfare based on choice and conditionality – are becoming embedded in e-service delivery, e-citizenship and in e-participation, with some residual notion of social justice in those relationships. In this context, agency is an important aspect in ensuring quality of care, participation and equality in society.

The discussion of the dynamics of inclusion and exclusion in relation to the Internet in Chapter 7 brings together the issues raised above and identifies contemporary inequalities. The idea of a digital divide can be understood as the differentiation between the Internet-haves and the Internet-have-nots, which can feed into and reinforce existing sources of inequality and social exclusion. The discussion moves beyond issues of access to situate the digital divide in the multidimensional dynamics of exclusion. Factors within these dynamics are socio-economic position, ethnicity, family status, geographic location, language, as well as educational capacity and digital literacy. The 'knowledge gap' and access to information is important in the dynamics of inclusion as they are used in life-long learning as resources for work and personal development. These dynamics are further complicated in the global digital divide, where lower Internet penetration in developing countries (although it can be uneven within these countries), combined with rapid changes of the Internet-based technological paradigm, requires that the less developed countries have to out-perform advanced economies just to stay where they are, thus fostering and reproducing global inequalities.

Chapter 8 discusses the ways in which the Internet is becoming embedded in everyday life, highlighting the ways in which social actors are negotiating their lived realities and cultural sensibilities in shaping the Internet through its use. Contemporary cultural change such as fragmentation, popular democratization and informalization influence the way the Internet is embedded in everyday life. The development of networked

individualism is shaping everyday life and the Internet is used as a tool for communication in this context. However, networked individualism and networks are grounded in institutions and the concept of 'domestication' shows how the Internet is becoming part of everyday life through the social relations of households and their moral economies. The argument opens up this discussion to address how the differentiated use of the Internet is culturally informed, by analysing the use of digital communication technology in a small rural town, in the cosmopolitan condition, in diasporic communities and in the mobile routines of the daily lives of mothers and children. Very often, in everyday life, the socio-cultural forms of the Internet are a combination of old and new forms of participation.

Chapter 9 discusses cyber culture in the context of late modern culture. Cyber cultures have a material dimension in that they consist of computing artefacts and websites; they also are symbolic in that they exist in fiction, film and in people's imaginations; and they are lived through the cyber experiences of people participating in cyber culture. Nonetheless, the notion of the 'virtual' is important in understanding cyber cultures, so it is considered in relation to the ways in which, and to what degree, social actors play with virtual identities, virtual communities and subcultures, as well as virtual sexualities. The early rhetoric surrounding cyber culture emphasized the possibilities of liberation from traditional forms of identity, community and sexuality. Although there are some examples of liberation, these hopes have not reached their envisaged potential; for example, in relation to gender and ethnic identity or in the reinvigoration of community. The practices of online interaction limit total free-play in virtual worlds because values such as trust, reciprocity and honesty in communication remain important in Internet-based communication. Cyber cultures emerge as a negotiated reality mediated between imaginations, on and off-line experiences and social mores, being facilitated by machines, wires and websites.

Chapter 10 addresses new media in the context of a new communications environment. The media is a defining feature and institution of modern and late modern life. The focus on new media reiterates the tension between the consumerization of the Internet on the one hand and its historical legacy of free and unregulated communication on the other. The dynamics of this tension feed into the communication environment of the public sphere. The key characteristics of new media, namely digitization and convergence, are discussed in relation to interactivity in mediated forms of communication and the rise of networks in the reshaping of a communications environment. The cultural contexts of new media developments show a relative under-determination of new media when compared with traditional media, as the medium does allow users to participate more interactively in media forms. However, although there are

some examples of innovative and participative new media, they are part of the media environment's culture of global capitalism. This is reproducing media concentration as well as generating new media nodes in the communications environment. The ubiquity of interactivity and more individualized use of new media raises questions on the quality of content and raises issues about online experience. For example, although social networking sites connect people with each other they also produce arenas of personalized and individualized entertainment, rather than cultural critique in an active public sphere. These issues situate the Internet in broader social and cultural change by exploring the ways in which new media is materializing in socio-cultural forms in everyday life and in broader institutional change.

In Chapter 11, the Conclusion, the analytical framework of the cultural form brings the main themes of the chapters together to discuss the characteristics of the relations of production, narratives of the medium and types of participation in the socio-cultural forms of the Internet. The relations of production are based in transnational informational capitalism, which is organized through networks. The narratives are about open and free communication based on interactive, flexible and networked communication. Forms of participation are based on the idea of users shaping the form, with freedom of communication and association. Overall, the interdependency of these three dimensions is producing the Internet as a socio-cultural form which is defined by its flexibility and adaptability to facilitate a range of socio-cultural forms. The socio-cultural shaping and materialization of the Internet in various forms and contexts of use mean it contains the contradictions of social life – therefore, one sees not freedom but the negotiation of constraints as people seek to sustain ways of life that are meaningful to them. In terms of the character of society, there have been some changes in the organization of capitalist society towards a networked, informational and intermediated society; however, there is continuity in social practices and cultural sensibilities that militate against the development of a narrow technocratic society. The focus, therefore, is on communication, with the evolvment of a highly communicative society in which the ability to connect is of paramount importance. Communication is cultural and the forms it takes both create and challenge institutions. The current communicative turn is both social and cultural and shapes the technologies which humans create. Given the contradictions of the Internet and of society, there is a need to secure culturally the ethos and capacity for everyone to be able to shape and participate in the forms of communication that the Internet allows.
